

OpenDrift

Installation

Software installation

Documentation of the model, including numerous examples, is available at https://opendrift.github.io

If you want to install OpenDrift on your own PC, the software is found here: https://github.com/OpenDrift/opendrift/

For use in the RAD320 classes, the installation of the OpenDrift model is already done by IT people, on the computers in dataroom U327

Set up conda environment

By using conda environment all the necessary libraries for running the model will be correctly installed

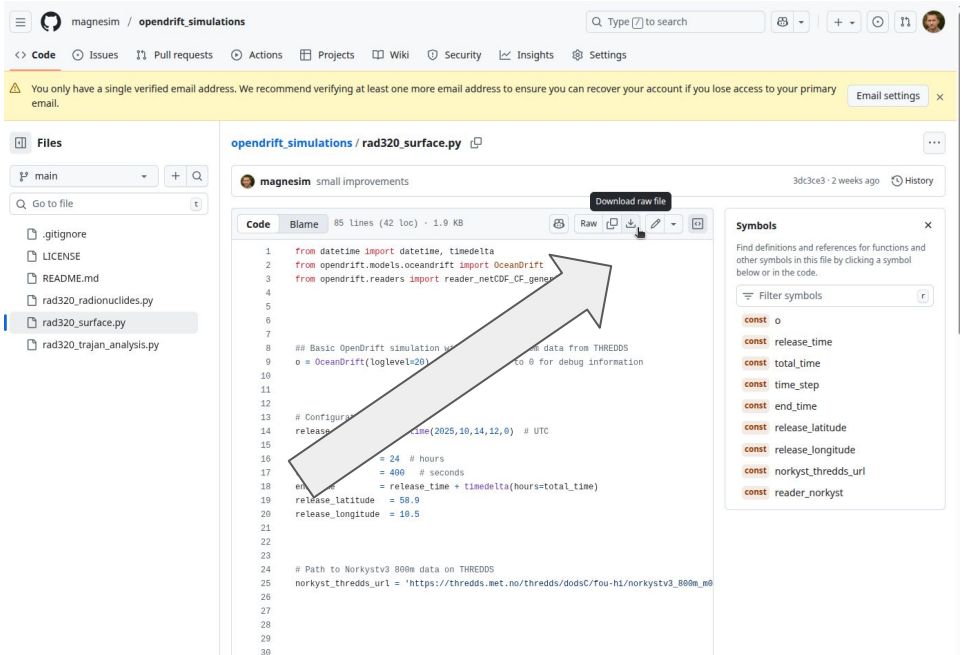

This must be done once by each user at his/her user profile on the NMBU workstations before the OpenDrift model can be used

- **Open “Anaconda Prompt”**
  - An app with a terminal window

- Navigate to C:\NMBU\OpenDrift
  - `cd \nmbu\opendrift`
- Set up opendrift environment
  - `conda create --name opendrift`
  - `conda env create -f environment.yml`
  - `conda activate opendrift`
  - `pip install --no-deps -e .`
- In case there is error due to permission rights
  - `git config …`
- Accept with ‘Y’ or ‘a’ where this is asked for

Download the OpenDrift python scripts

Download the examples from https://github.com/magnesim/opendrift_simulations/ and save them on your computer somewhere you can find them later

Run the OpenDrift simulation

In **anaconda prompt**, go to the folder where you have saved the python files

E.g.,

- `cd C:\Documents\rad320`

In anaconda prompt, activate the opendrift conda environment

- `conda activate opendrift`

In anaconda prompt, run the script by typing the following command

- `python rad320_surface.py`

Edit the python scripts

Python scripts (ending with ‘.py’) are text files, and can be edited in any text editor, e.g., Notepad, Visual Studio Code, Atom, Vim, …

Do modifications, save the rad320_surface.py file and rerun the simulation
